TRIMESTER DEFINITIVE BUDGET OF WORK (DBOW)
REVISED K TO 10 CURRICULUM
S.Y. 2026-2027
SCIENCE 10

FIRST TERM (54 Days)	
CONTENT STANDARD	The learners learn that: 1. Several simple observations indicate if a chemical reaction has taken place. 2. Chemical indicators produce color changes with acids, bases, and salts. 3. Valid and reliable scientific investigations identify the dependent and independent variables and control other variables. 4. Many types of chemical reactions are important in our daily lives and in the biotic and abiotic parts of the environment. 5. Atoms rearrange during chemical reactions but abide by the principle of conservation of mass as illustrated in balanced chemical equations. 6. Rates of chemical reactions are critical in production and preservation of many useful materials. 7. Homeostasis is a self-regulating process that allows an organism to maintain stability.

	8. Several theories provide lines of evidence about how organisms evolve.
PERFORMANCE STANDARD	By the end of the term, learners use household products as indicators to identify acids, bases, and salts and describe indicators that a chemical reaction has occurred. They describe important types of chemical reactions, use chemical equations and conservation of mass to represent and balance reactions, and explain impacts on the natural and built environments using secondary sources. Also, learners explain factors affecting reaction rates and exothermic and endothermic reactions, demonstrate valid and reliable investigations, describe homeostasis and feedback mechanisms, and explain biotechnology by identifying traditional and modern examples and debating societal, environmental, and ethical implications.
SUGGESTED PERFORMANCE TASK	**1. Vegetable Indicator Investigation –** Conduct a valid and reliable investigation to test vegetables (e.g., carrots, red cabbage) to determine their usefulness as indicators for common acids and bases (e.g., vinegar, lemon juice, bleach). **2. Home Chemical Reactions Exploration –** Explore materials in the home to produce specific chemical reactions (e.g., washing powder solution mixed with baking powder solution). **3. Biotechnology Critical Analysis –** Write a critical analysis of the use of biotechnology and its impacts on society or the environment.

CONTENT	WEEK NO.	LEARNING COMPETENCIES and CODE	NUMBER OF DAYS TAUGHT
Chemical Reactions	Week 1	**Describe the indicators for a chemical reaction as color change, the formation of a precipitate, the release of gas, and or odor, or a change in temperature; Identify that chemical reactions may be exothermic or endothermic.**	
		DAY 1: Identify the observable indicators of a chemical reaction such as color change, formation of a precipitate, release of gas or odor, and change in temperature.	1
		DAY 2: Explain how the observable indicators show that a chemical reaction has occurred.	1
Acids, Bases, and Salts		**Identify common acids, bases, and salts (e.g., hydrochloric acid, sodium hydroxide, and saline solution) using different indicators**	
		DAY 3: Identify common acids, bases, and salts such as hydrochloric acid, sodium hydroxide, and saline solution using different indicators.	1
		Day 4: Differentiate acids, bases, and salts based on their properties and examples.	1
		Day 5: Identify common acids, bases, and salts using natural indicators from vegetables (e.g., red cabbage and carrots) through a simple investigation.	1
Types of Chemical Reactions	Week 2	**Describe important types of chemical reactions (combination, decomposition, single replacement, double replacement)**	
		DAY 1: Identify the characteristics and general form of a combination (synthesis) reaction.	1
		DAY 2: Explain the process and products formed in a decomposition reaction	1
		DAY 3: Differentiate between single replacement and double replacement reactions based on reactant and product patterns.	1
		DAY 4: Classify given chemical equations according to the type of chemical reaction they represent.	1
		DAY 5: Determine the products of simple combination, decomposition, single replacement, and double replacement reactions using chemical formulas.	1

Chemical Reactions in the Environment	Week 3	**Explain how important types of chemical reactions, such as combustion, acids on metals, acids on carbonates, photosynthesis, and respiration, relate to or impact the natural and built environments using information from secondary sources**	
		DAY 1: Describe the key characteristics and reactants/products of combustion, acid-metal, acid-carbonate, photosynthesis, and respiration reactions.	1
		DAY 2: Analyze how combustion reactions contribute to environmental issues such as air pollution and climate change.	1
		DAY 3: Explain the effects of acid reactions on metals and carbonates in the deterioration of buildings, monuments, and infrastructure.	1
		DAY 4: Discuss the role of photosynthesis and respiration in maintaining the balance of gases in the atmosphere and supporting life processes.	1
		DAY 5: Gather and explain information from secondary sources to evaluate the positive and negative impacts of these chemical reactions on both natural ecosystems and human-made environments.	1
		SUMMATIVE TEST	1
Chemical Equations	Week 4	**Recognize that scientists:** **a. use chemical equations to describe chemical reactions, and** **b. write equations in word form and using formula for common chemical reactions**	
		DAY 1: Identify the basic components of a chemical equation, including reactants, products, and symbols used to represent chemical reactions.	1
		DAY 2: Translate simple chemical reactions from word form to symbolic (formula) form and vice versa.	1
		DAY 3: Differentiate between balanced and unbalanced chemical equations and demonstrate how to balance simple equations.	1

		DAY 4: Explain the purpose of using chemical equations in representing and understanding chemical reactions.	1
		DAY 5: Apply knowledge of chemical equations to describe common reactions such as combustion, synthesis, decomposition, and neutralization.	1
	Week 5	**Explain that chemical equations demonstrate a rearrangement of atoms but the total mass of the system remains the same during a chemical reaction**	
		DAY 1: Describe how atoms rearrange during a chemical reaction using particle models.	1
		DAY 2: Interpret simple chemical equations to identify reactants, products, and atom rearrangement.	1
		DAY 3: Explain the Law of Conservation of Mass using experimental evidence.	1
		DAY 4: Balance simple chemical equations to show equal numbers of atoms on both sides.	1
		DAY 5: Relate balanced equations to the law of conservation of mass in real-life reactions.	1
	Week 6	**Apply the principles of conservation of mass to balance chemical equations**	
		DAY 1: Explain the principle of conservation of mass and describe how atoms are neither created nor destroyed during chemical reactions.	**1**
		DAY 2: Distinguish between balanced and unbalanced chemical equations by counting atoms on both sides.	1
		DAY 3: Balance simple chemical equations using coefficients while applying conservation of mass.	1
		DAY 4: Apply balancing strategies to more complex equations and explain their reasoning.	1
		DAY 5: Relate balanced equations to real-world chemical processes and demonstrate mastery through problem solving.	1
		SUMMATIVE TEST	1

Rates of reactions	Week 7	**Explain the factors affecting the rates of chemical reactions as applied in food preservation and materials production, control of fire, pollution, and corrosion**	
		DAY 1: Explain how temperature affects reaction rate and relate it to food spoilage and preservation.	1
		DAY 2: Describe how surface area affects reaction rate and explain its importance in materials processing and combustion.	**1**
		DAY 3: Explain how concentration influences reaction rate and connect it to pollution control and safe chemical use.	1
		DAY 4: Explain the role of catalysts and relate them to industrial production and pollution reduction.	1
		DAY 5: Analyze how controlling reaction conditions affects fire prevention, corrosion, and preservation.	1
Homeostasis	Week 8	**Describe homeostasis as a state of balance among all the body systems in humans that needs to be maintained for survival and proper functioning; its indicators include body temperature, glucose level, and blood pressure;**	
		DAY 1: Describe homeostasis as a state of balance among body systems in humans that needs to be maintained for survival and proper functioning.	1
		DAY 2: Identify key indicators of homeostasis, including body temperature, glucose level, and blood pressure.	1
		DAY 3: Explain how various body systems (nervous, endocrine, and circulatory) work together to regulate body temperature, glucose level, and blood pressure and maintain homeostasis.	1
		DAY 4: Explain the importance of homeostasis for the survival and proper functioning of the human body.	1
		DAY 5: Analyze how homeostasis is maintained or disrupted in different scenarios (e.g., fever, hunger, intense exercise) and predict the effects on the body.	1

	Week 9	**Explain how homeostasis is maintained through various feedback mechanisms, both positive and negative;**	
		DAY 1: Describe homeostasis and how feedback mechanisms maintain stability in the body.	1
		Day 2: Describe the components of a feedback mechanism, including sensors, control centers, and effectors.	1
		DAY 3: Explain positive feedback mechanisms used in homeostasis	1
		Day 4: Explain negative feedback mechanisms used in homeostasis.	1
		DAY 5: Differentiate between positive and negative feedback mechanisms and analyze their effects on homeostasis.	1
Mechanisms of Evolution	Week 10	**Use information from secondary sources to describe natural selection as the primary mechanism driving evolutionary change;**	
		DAY 1: Define evolution as the heritable change in populations and species over time.	1
		DAY 2: Explain the occurrence of evolution according to Darwin's ideas.	1
		DAY 3: Describe natural selection as the mechanism by which species adjust to their environment through evolutionary changes.	1
		Discuss in small groups important concepts in the theories of evolution, such as variation, heredity, isolation, selection, and adaptation;	
		DAY 4: Identify the key concepts associated with evolution: variation, heredity, isolation, selection, and adaptation.	1
		Day 5: Analyze how variation, heredity, isolation, selection, and adaptation influence evolutionary changes in populations.	1
	Week 11	**DAY 1:** Describe how the fossil record provides evidence for the evolution of organisms over time.	**1**

		DAY 2: Explain how rock formation, the geologic time scale, and carbon-14 dating can be used in determining the age of fossils.	1
		DAY 3: Analyze how the geographical distribution of species supports the theory of evolution.	1
		DAY 4: Use comparative anatomy and molecular evidence to explain how evolutionary relationships and common ancestry are supported.	1
		DAY 5: Create a diagram, concept map, or presentation showing how fossils, biogeography, comparative anatomy, and molecular evidence support the occurrence of evolution.	1
		TERM EXAMINATION	

SECOND TERM (55 Days)	
CONTENT STANDARD	The learners learn that: 1. Population growth influences the carrying capacity of an ecosystem. 2. The products and processes of biotechnology can have both beneficial and harmful effects on society and the environment. 3. Current models explain tectonic plate movement as part of a gravity-driven convection system that pushes young hot plates away from spreading ridges and pulls old cold plates down into subduction zones. 4. Plate movements and continental evolution account for the major surface features of the Earth. 5. Climate change and its impacts on the environment and people pose serious challenges which require solutions and action at local and global levels. 6. The rich natural resources of the Philippines require sustainable management.
PERFORMANCE STANDARD	By the end of the term, learners describe homeostasis as a process that allows an organism to maintain stability and discuss the factors that limit the ecosystem's carrying capacity and the role of population growth. They describe and discuss in small groups that natural selection is the driving mechanism of evolutionary change, use information from secondary sources to explain lines of evidence that support the occurrence of evolution, and explain the meaning of the term biotechnology and debate the societal, environmental, and ethical implications of utilizing biotechnological products and methods. Also, learners describe and explain the geologically dynamic nature of the Philippine Archipelago by using models to

	explain tectonic plate movement and continental evolution, gather information from secondary sources to identify evidence of global warming and climate change and suggest ways individuals can reduce impacts and how increased societal uses of renewable energies could mitigate climate change, and use Newton's laws to explain projectile motion and collisions and gather information from secondary sources to evaluate how renewable and non-renewable electricity generation in the Philippines impacts human activities and the environment.
SUGGESTED PERFORMANCE TASK	**A. Community Education Strategy on Natural Resources and Sustainability –** Plan and enact a community education strategy highlighting the importance of natural resources and sustainable management of resources. B. **Green Metals Discussion Paper –** Develop a discussion paper about the need for "green metals" (e.g., cobalt, nickel) for the electrification of vehicles and possible impacts of mining for these metals.

CONTENT	WEEK NO.	LEARNING COMPETENCIES and CODE	NUMBER OF DAYS TAUGHT
Ecosystem's carrying capacity and	Week 1	**Discuss the factors that limit the ecosystem's carrying capacity, such as adequate food, shelter, water, and mates;**	
		DAY 1: Identify the factors that limit an ecosystem's carrying capacity, including food, water, shelter, and mates.	**1**

population growth		DAY 2: Explain how food, water, shelter, and mates influence the survival and reproduction of organisms in an ecosystem.	**1**
		DAY 3: Demonstrate how changes in the availability of food, water, shelter, and mates affect the carrying capacity of a population through simulations, graphs, or case studies.	**1**
		DAY 4: Analyze the effects of different limiting factors on population size and carrying capacity in various ecosystem scenarios.	**1**
		DAY 5: Evaluate ecosystem situations and propose practical solutions to maintain population balance by managing factors that limit carrying capacity.	**1**
	Week 2	**Explain that the ecosystem's population growth slows down as it gets closer to the carrying capacity.**	
		DAY 1: Define carrying capacity and population growth in an ecosystem.	**1**
		DAY 2: Describe how populations grow in an ecosystem under ideal conditions.	**1**
		DAY 3: Explain how limited resources affect the rate of population growth over time.	**1**
		DAY 4: Analyze graphs showing population growth and identify how growth slows as it nears carrying capacity.	**1**
		Day 5: Evaluate real-life ecosystem situations and predict what happens to population growth as it approaches carrying capacity.	**1**
Biotechnology	Week 3 & 4	**Use information from secondary sources to identify the products of traditional biotechnology through fermentation (e.g., cheese, soy sauce, vinegar, nata de coco);**	
		DAY 1: Differentiate between traditional and modern biotechnology with examples of each.	**1**
		DAY 2: Define fermentation and explain its importance in traditional biotechnology.	**1**
		DAY 3: Identify the role of microorganisms (bacteria, yeast, and molds) in fermentation.	**1**
		DAY 4: Explain the basic process of fermentation through guided discussion and examples.	**1**

		DAY 5: Identify products of traditional biotechnology such as cheese, soy sauce, vinegar, and nata de coco.	**1**
		SUMMATIVE TEST	**1**
		DAY 6: Describe the microorganisms involved in producing specific fermented products.	**1**
		DAY 7: Conduct a simple fermentation experiment (e.g., vinegar or yeast fermentation) and observe initial changes.	**1**
		DAY 8: Record and analyze observations from the fermentation experiment and relate results to microbial activity.	**1**
		DAY 9: Analyze the importance of fermentation in food preservation, shelf life, flavor, and nutrition.	**1**
		DAY 10: Demonstrate understanding by presenting the results of the fermentation experiment and outlining the step-by-step process of producing one fermented product.	**1**
	Week 5	**Use information from secondary sources to identify examples of modern biotechnology, such as genetically modified organisms and processes (e.g., in vitro fertilization);**	
		DAY 1: Define modern biotechnology and identify its importance in science and society.	**1**
		DAY 2: Identify examples of modern biotechnology, such as genetically modified organisms (GMOs) and in vitro fertilization (IVF).	**1**
		DAY 3: Describe how GMOs and IVF are used in agriculture, medicine, and human reproduction.	**1**
		DAY 4: Analyze the benefits and possible risks or ethical issues of modern biotechnology applications.	**1**
		DAY 5: Evaluate real-life situations involving modern biotechnology and justify opinions using evidence from secondary sources.	**1**
	Week 6	**Participate in a class debate on the societal, environmental, and ethical implications of using biotechnological products and methods.**	

		DAY 1: Recognize biotechnology as a scientific innovation used in agriculture, medicine, and industry through real-life examples.	**1**
		DAY 2: Explain how selected biotechnological products and processes (e.g., GM crops, vaccines, IVF) are used in society.	**1**
		DAY 3: Compare the benefits of biotechnology in health, agriculture, and the environment using secondary sources.	**1**
		DAY 4: Analyze societal, environmental, and ethical issues related to the use of biotechnology and support ideas with evidence.	**1**
		DAY 5: Participate in a structured debate by presenting and defending a position on biotechnology issues using evidence-based arguments.	**1**
		SUMMATIVE TEST	**1**
Global Climate	Week 7	**Identify evidence of global warming and climate change;**	
		DAY 1: Define global warming and climate change using scientific descriptions.	**1**
		DAY 2: Identify observable evidence of climate change such as rising temperatures, melting ice caps, and sea level rise.	**1**
		DAY 3: Explain how scientific data (temperature records, weather patterns, and graphs) show evidence of global warming.	**1**
		DAY 4: Analyze different sources of evidence (graphs, reports, and case studies) to determine trends in climate change.	**1**
		DAY 5: Evaluate real-world situations and justify conclusions about the presence of global warming using evidence.	**1**
	Week 8	**Identify the role of greenhouse gases in enhanced global warming and climate change;**	
		DAY 1: Define greenhouse gases and identify common examples such as carbon dioxide, methane, and water vapor.	**1**
		DAY 2: Describe how the natural greenhouse effect works in keeping Earth warm.	**1**
		DAY 3: Explain how increased greenhouse gas emissions from human activities enhance global warming.	**1**

		DAY 4: Analyze the relationship between greenhouse gas concentration and rising global temperatures using graphs or data.	**1**
		DAY 5: Evaluate human activities and propose actions to reduce greenhouse gas emissions and lessen climate change impacts.	**1**
Global Interaction	Week 9	**Describe how global climatic phenomena, such as the El Niño Southern Oscillation, may impact weather systems;**	
		DAY 1: Define global climatic phenomena such as El Niño and La Niña and identify basic characteristics of each.	**1**
		DAY 2: Describe the normal weather patterns in the Pacific region during neutral conditions.	**1**
		DAY 3: Explain how El Niño and La Niña affect temperature, rainfall, and wind patterns in different regions.	**1**
		DAY 4: Analyze the effects of ENSO events on extreme weather conditions such as droughts, floods, and storms using case examples.	**1**
		DAY 5: Evaluate how ENSO-related weather changes impact human activities (e.g., agriculture, fishing, disaster preparedness) and propose adaptation measures**.**	**1**
Global and local Sustainability	Week 10	**Identify local impacts of global climate change and suggest ways that individuals can do to reduce the impact of global warming;**	
		DAY 1: Define global climate change and identify its basic causes.	**1**
		DAY 2: Identify local evidence and impacts of climate change (e.g., flooding, heat waves, stronger typhoons, drought).	**1**
		DAY 3: Explain how local environmental changes are linked to global climate change.	**1**
		DAY 4: Analyze how climate change affects communities, livelihoods, health, and the environment using real-life examples.	**1**
		DAY 5: Suggest and evaluate practical actions individuals can do to reduce the effects of global warming and promote environmental sustainability.	**1**

	Week 11	**Explain how increased societal uses of renewable energies could mitigate the effects of global climate change, including how the Philippines could make better use of its plentiful natural resources**	
		DAY 1: Identify various renewable energy sources available in the Philippines.	**1**
		DAY 2: Explain how the increased use of renewable energy can mitigate the effects of global climate change.	**1**
		DAY 3: Describe the rich natural resources of the Philippines that require sustainable management.	**1**
		DAY 4: Propose strategies for the better societal use of the country's plentiful natural resources.	**1**
		DAY 5: Formulate a simple plan for the sustainable management of a local resource to address climate challenges.	**1**
		TERM EXAMINATION	

THIRD TERM (57 Days)	
CONTENT STANDARD	The learners learn that, 1. Current models explain tectonic plate movement as part of a gravity-driven convection system that pushes young hot plates away from spreading ridges and pulls old cold plates down into subduction zones. 2. Plate movements and continental evolution account for the major surface features of the Earth. 3. Newton's laws can be used to explain projectile motion and collisions. 4. Momentum in collisions increases as mass or velocity increases.
PERFORMANCE STANDARD	By the end of the term, learners describe and explain the geologically dynamic nature of the Earth by using models and secondary sources to illustrate tectonic plate movements, interactions at plate boundaries, and the formation of major geological features such as mountains, volcanoes, and ocean trenches, with emphasis on the Philippine Archipelago. They investigate and predict changes in Earth's surface over time based on plate movement. Learners also apply Newton's laws of motion to explain projectile motion and analyze momentum and collisions in real-world situations, including safety applications such as seatbelts and airbags.
SUGGESTED PERFORMANCE TASK	• **Local Vehicular Accident Risk Survey and Road-Safety Recommendations** – Conduct a survey of recent vehicular accidents in a local area and identify a high-risk spot; suggest ways to minimize or avoid collisions in that area.

	• **Egg Protection Vehicle Drop Challenge** – Design and build a vehicle and use it to save a raw egg from breaking after falling from a height of 3 meters.

CONTENT	WEEK NO.	LEARNING COMPETENCIES	NUMBER OF DAYS TAUGHT
Plate Tectonics	1	**Identify modern scientific processes used to detect and measure the displacement pf tectonic plates.**	
		DAY 1: Describe the scientific processes involved in measuring the rate and direction of tectonic plate movements.	**1**
		DAY 2: Identify the modern scientific instruments, such as GPS and satellite laser ranging, used to detect plate displacement.	**1**
		DAY 3: Explain how data from scientific measurements provide evidence for the theory of plate tectonics.	**1**
		Describe the structures, movements and events that occur at each type of plate boundary;	
		DAY 4: Identify the three primary types of plate boundaries: divergent, convergent, and transform.	**1**
		DAY 5: Describe how continental-oceanic convergence occur in terms of geologic events and features formed.	**1**
	2	**DAY 6:** Describe how oceanic-oceanic convergence occur in terms of geologic events and features formed.	**1**
		DAY 7: Describe how continental-continental convergence occur in terms of geologic events and features formed.	**1**
		DAY 8: Describe how divergence occur in terms of geologic events and features formed.	**1**
		DAY 9: Describe how transform fault boundary occurs in terms of geologic events and features formed.	**1**

		DAY 10: Describe how plate movements help shape the surface of the earth.	**1**
	3	**Identify the locations of major mountains, faults, volcanos, and ocean trenches using a map of the Philippine Archipelago, and interpret the features in relation to plate tectonics;**	
		DAY 1: Identify the locations of major mountains, faults, and volcanoes on a map of the Philippines.	**1**
		DAY 2: Locate the major ocean trenches surrounding the Philippine Archipelago.	**1**
		DAY 3: Interpret the distribution of these Philippine geological features in relation to local plate tectonics.	**1**
		Predict the position and shape of the Philippine Archipelago in 50 million years, based on the current velocity of the Philippine Plate	
		DAY 4: Predict the future position of the Philippine Archipelago 50 million years from now based on current movement.	**1**
		DAY 5: Describe the projected changes in the shape of the Philippines due to ongoing tectonic movements.	**1**
		SUMMATIVE TEST	**1**
	4	**Gather information from secondary sources to describe and explain what mechanisms that drive the movement of tectonic plates including the role of the asthenosphere;**	
		DAY 1: Gather information from secondary sources to describe the mechanisms that drive tectonic plate movement.	**1**
		DAY 2: Describe the role of the asthenosphere in facilitating the movement of the lithospheric plates.	**1**
		DAY 3: Explain how "ridge push" at spreading ridges contributes to the movement of young plates.	**1**
		DAY 4: Explain how "slab pull" at subduction zones drives the movement of cold, old plates.	**1**
		DAY 5: Summarize the gravity-driven convection system that powers the movement of tectonic plates.	**1**

	5	**Explain how the subduction of an oceanic plate impacts on the plate above it;**	
		DAY 1: Describe the physical process of subduction when an oceanic plate interacts with another plate.	**1**
		DAY 2: Explain the geological impacts of subduction on the overlying plate, such as volcanic arc formation.	**1**
		Explain how plate tectonics can be used to explain the formation of the largest mountain ranges on Earth including the Himalayas and the Andes mountains;	
		DAY 3: Identify the specific tectonic processes that led to the formation of the Himalayas.	**1**
		DAY 4: Explain the role of plate tectonics in the creation of the Andes Mountain range.	**1**
		SUMMATIVE TEST	**1**
Projectile Motion	6	**Investigate and describe the relationship among the projectile variables including the angle and velocity of release, and projectile height and range, using everyday activities such as shooting basketballs or kicking footballs.**	
		DAY 1: Describe projectile motion and identify its components by labeling a diagram with terms trajectory, range, maximum height and velocity components.	**1**
		DAY 2: Differentiate horizontal and vertical components of projectile motion through simple demonstrations.	**1**
		DAY 3: Identify the components of projectile motion in real life examples/activities.	**1**
		DAY 4: Describe the relationship among the projectile variables (range, time of flight, maximum height) as expressed in their formula.	**1**
		DAY 5: Solve problems involving time of flight and maximum height using appropriate formulas.	**1**
		SUMMATIVE TEST	**1**
	7	**DAY 6:** Compute the range of a projectile using given values of velocity and angle.	**1**

		DAY 7: Solve multi-step projectile motion problems involving height, range and time accurately.	**1**
		DAY 8: Conduct a simple experiment and observe how varying angle of release affects the height and range of a projectile	**1**
		DAY 9: Determine the relationship between angle, height and range based on the experiment.	**1**
		DAY 10: Explain how projectile motion principles improve performance in sports.	**1**
Momentum and Collision	8	**Describe different types of collisions as elastic or inelastic by providing some examples.**	
		DAY 1: Describe the different characteristics of elastic and inelastic collisions.	**1**
		DAY 2: Identify examples of elastic and inelastic collisions in real life activities.	**1**
		Use models to investigate elastic or inelastic collisions and describe the forces involved and their effects;	
		DAY 3: Demonstrate elastic collisions using different models.	**1**
		DAY 4: Demonstrate inelastic collisions using different models.	**1**
		Day 5: Interpret simple diagrams or models showing colliding objects by identifying the different forces involved and its effects.	**1**
	9-11	**Explain that momentum depends on the mass and the velocity of a moving object that can be used to predict the impact the object will have if it hits another object;**	
		DAY 1: Define momentum as the product of mass and velocity	**1**
		DAY 2: Describe the momentum of moving objects.	**1**
		DAY 3: Predict the possible impact of an object if it hits another object based on its momentum.	**1**
		Carry out guided investigations using different objects to describe momentum-related relationships, such as the more momentum an object has, the harder for it to stop;	
		DAY 4: Investigate how varying the mass of the object affect its momentum.	**1**
		DAY 5: Investigate how varying the velocity of the object affect its momentum.	**1**

		DAY 6: Explain the relationship of mass and velocity to the momentum of an object.	**1**
		Identify that momentum is conserved before and after the collision of objects.	
		DAY 7: Describe what happens to the total momentum before and after a collision in a closed system.	**1**
		DAY 8: Use the Law of Conservation of Momentum in determining the total momentum of a closed system.	**1**
		Identify and explain that to change the momentum of an object, it is necessary to apply a force on the object over a period of time;	
		DAY 9: Determine the effect of force applied on the momentum of an object.	**1**
		DAY 10: Describe how force applied, and time changes an object's momentum.	**1**
		DAY 11: Identify real life situations (like kicking and catching a ball) showing effects of changing momentum by varying the force and time.	**1**
		Gather information from secondary sources to identify ways to reduce the impact of collisions such as seatbelts, airbags, and crumple zones in vehicles;	
		DAY 12: Identify the purpose of common vehicle safety features such as seatbelts, airbags, and crumple zones.	**1**
		DAY 13: Interpret diagrams showing force distribution in a vehicle collision.	**1**
		DAY 14: Apply the concept of force and momentum to explain why these vehicle safety features reduce injury risk.	**1**
		DAY 15: Design possible safety features in vehicles and other modes of transportation by applying the concepts of momentum and collision.	**1**
		TERM EXAMINATION
